Topic 5 Assignment

Student name

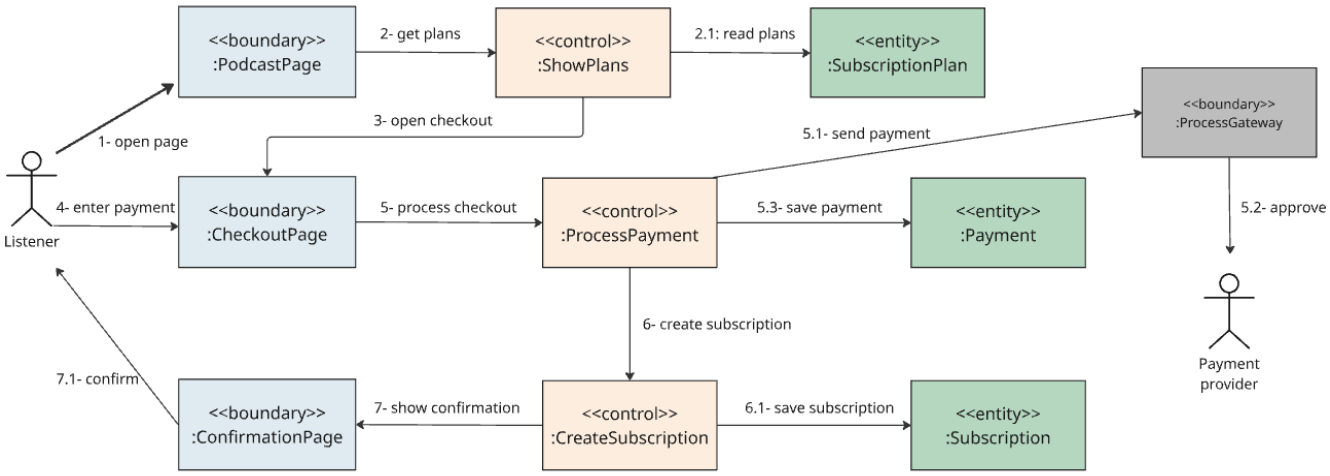

Hyechan Shin

Robert Gabrielsson

Introduction

In this assignment, we converted the BCE diagram from Topic 4 into two UML diagrams: a collaboration diagram and a sequence diagram. Both diagrams are based on the "Buy Podcast Subscription" use case for AudioNow. We followed the Visual Paradigm tutorials.

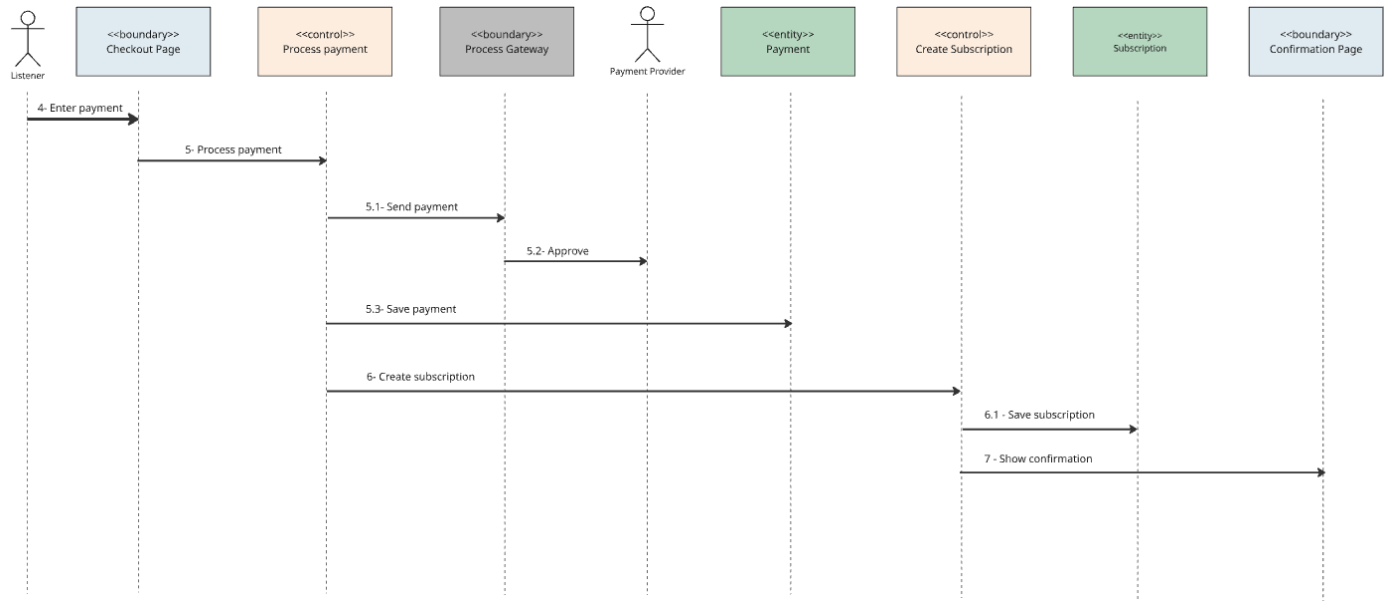

Collaboration diagram

We've kept the objects and links from the previous BCE diagram and added numbered messages. The numbers are shown in chronological order.

First, the Listener opens the Podcast page, and Show Plans retrieves the plans from Subscription Plan. Then, Show Plans opens the Checkout page, where the Listener enters the payment details. Next, Process Payment sends the payment to the payment gateway. The payment provider approves the payment, after which the payment is saved and the subscription is created. Finally, the confirmation page is shown to the Listener.

Sequence diagram

In this section, we have selected the payment scenario. We chose this scenario because it is the most important step. First, the listener enters payment details on the checkout page, then process payment sends the payment to payment gateaway, the payment provider approves it, and the payment is saved. Once payment is done, the subscription will be created and saved. Finally confirmation is shown.

AI Declarations

No AI was used in this assignment.
