Project Overview

Project Name:
Smart Luggage Damage Claim Automation

Organization Name:
Finnair

Project Sponsor/Contact Person:

- *Senior Project Manager - Hyechan Shin hyechan.shin@student.lut.fi*
- *Chief of Customer Satisfaction - Amirhossein Mirsoleimani amirhossein.mirsoleimani@student.lut.fi*

Problem Description

1. Current Situation/Problem:

Problem: Long and costly processing of the luggage damage claims system.

The current luggage damage claim system is tedious, lengthy, and requires the customer to personally visit Finnair offices. We want to digitalize and automate this process to improve user experience and customer satisfaction.

2. Business Goals and Objectives:

Main goal: Digitalization and automation of luggage damage claims in Finnair application.

- Reduce the processing time for damage claim
- Reduce the unnecessary steps
- Reduce the manual work
- Improve user experience
- Increase customer satisfaction
- Streamline the claim process

3. Target Users/Stakeholders:

- Primary users are Finnair passengers.
- Finnair baggage services claims agents.
- Insurance companies.
- Luggage repair service company.
- Administrators.
- Auditors.

4. Proposed Solution/Expectations:
We envision a luggage damage claim section to be added to our web and mobile application. The new feature should have an AI chat bot that gives preliminary instructions and collects initial data. The chat bot should then redirect the case to human operators based on the severity of the case. The feature should contain relevant forms and fields for the customer to enter their flight information, details of the incident, and attach photos as proof. Moreover, the

feature should have a damage claim tracking section that keeps the customer informed about the status of their claim. In addition, the features should contain a relevant page for the customer to interact with a human operator during the claim process to provide additional information as requested by the operators.

Constraints and Considerations:

1. Budget Constraints:

We have allocated the following budget categories and their respective limits:

- *Initiation phase budget 5,000 €*
- *Design and Development phase budget 20,000 €*
- *Integration and Implementation phase budget 10,000 €*
- *Maintenance and testing phase budget 15,000 €*

2. Timeframe:

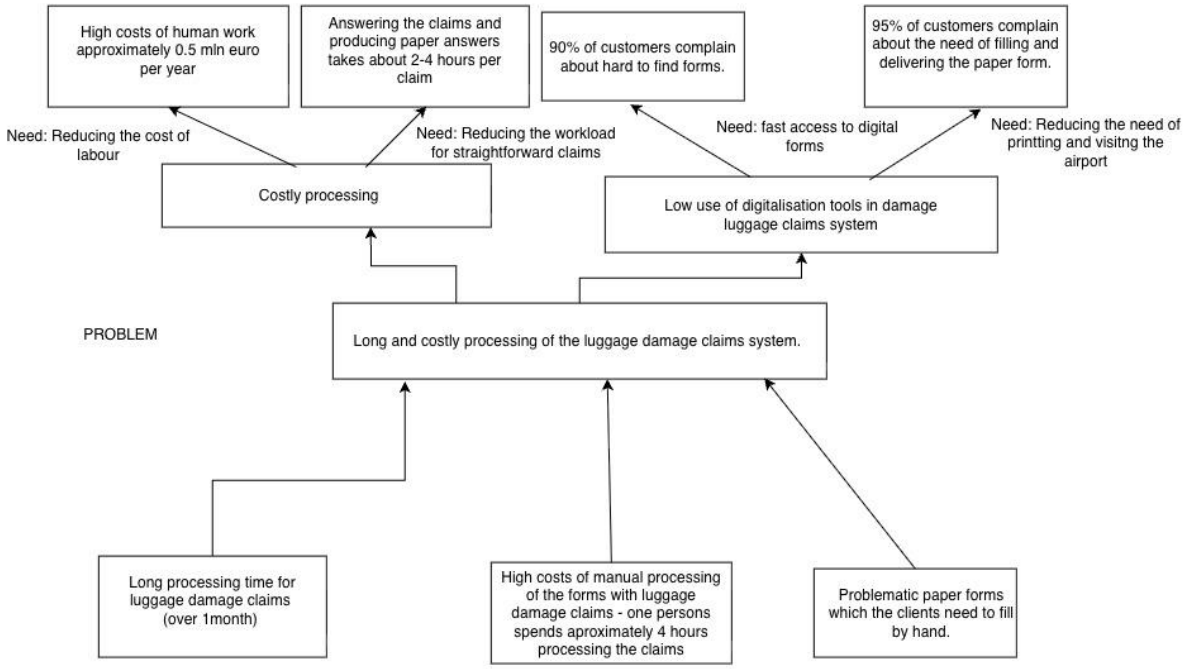

9-12 months from piloting to launch

- Initiation phase: 1 month
- Design and Development phase: 4 months
- Integration and Implementation phase: 2 months
- Maintenance and testing phase: 3 months
- Live production environment delivery: 2 months

Final deadline: End of 2028
